【Glass recycle】 To return to a shape closer to nature ..

Microsizer is a revolutionary machine that can treat waste bottles and waste glass into square-handled particle sands that can be handled safely and provide them as new resources for various recycling businesses. Glass is made of SiO_2 , Na_2O , CaO , Al_2O_3 and other natural materials. By changing the particle size from 5 millimeters to 0.5 millimeters, it is possible to naturally return it without affecting water quality or organisms. Once we are able to return to nature, we expect demand in a variety of fields as well as sand. Cullet that is colored and cannot be returned to the raw material for glass bottles can also be recycled. As environmental issues become increasingly pronounced on a global scale, we are looking forward to the wider world under the theme of "friendly to the earth".

Glass sand by microsizer treatment

【Glass recycle】 Crushing equipment from sheet glasses ..

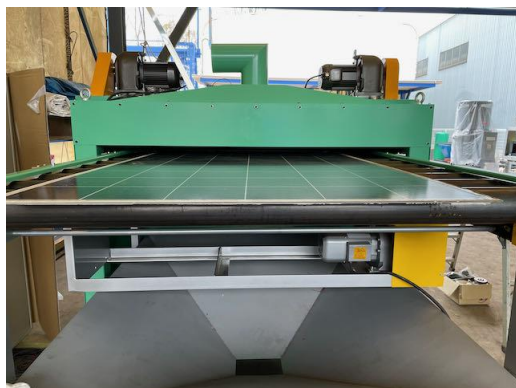

There are Laminated glass, Double glazing glass, tempered glass, PV covered glass and so on in our life. Most of cases, used glasses are either discarded or incinerated for waste disposal. Our proposal equipment should be a promising solution for overcoming glass disposal issues, because we can produce smaller cullet size without impurities by roller crushing system.
